FCC WARNING STATEMENT

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of FCC Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at his expense.

FCC COMPLIANCE STATEMENT

This device complies with Part 15 of the FCC Rules. Operation of this device is subject to the following conditions: this device may not cause harmful interference and this device must accept any interference received, including interference that may cause undesired operation.

CANADIAN DOC STATEMENT

This digital apparatus does not exceed the Class B limits for radio noise for digital apparatus set out in the Radio Interference Regulations of the Canadian Department of Communications.

Le présent appareil numérique n'émet pas de bruits radioélectriques dépassant les limites applicables aux appareils numériques de la classe A prescrites dans le Règlement sur le brouillage radioélectrique édicté par le ministère des Communications du Canada.

CE STANDARDS

An independent laboratory performed testing for compliance to CE requirements. The unit under test was found compliant to Class B.

LIMITED WARRANTY

ID TECH warrants to the original purchaser for a period of 12 months from the date of invoice that this product is in good working order and free from defects in material and workmanship under normal use and service. ID TECH's obligation under this warranty is limited to, at its option, replacing, repairing, or giving credit for any product that returned to the factory of origin with the warranty period and with transportation charges and insurance prepaid, and which is, after examination, disclosed to ID TECH's satisfaction to be defective. The expense of removal and reinstallation of any item or items of equipment is not included in this warranty. No person, firm, or corporation is authorized to assume for ID TECH any other liabilities in connection with the sales of any product. In no event shall ID TECH be liable for any special, incidental or consequential damages to purchaser or any third party caused by any defective item of equipment, whether that defect is warranted against or not. Purchaser's sole and exclusive remedy for defective equipment, which does not conform to the requirements of sales, is to have such equipment replaced or repaired by ID TECH. For limited warranty service during the warranty period, please contact ID TECH to obtain a Return Material Authorization (RMA) number & instructions for returning the product.

THIS WARRANTY IS IN LIEU OF ALL OTHER WARRANTIES OF MERCHANTABILITY OR FITNESS FOR PARTICULAR PURPOSE. THERE ARE NO OTHER WARRANTIES OR GUARANTEES, EXPRESS OR IMPLIED, OTHER THAN THOSE HEREIN STATED. THIS PRODUCT IS SOLD AS IS. IN NO EVENT SHALL ID TECH BE LIABLE FOR CLAIMS BASED UPON BREACH OF EXPRESS OR IMPLIED WARRANTY OF NEGLIGENCE OF ANY OTHER DAMAGES WHETHER DIRECT, IMMEDIATE, FORESEEABLE, CONSEQUENTIAL OR SPECIAL OR FOR ANY EXPENSE INCURRED BY REASON OF THE USE OR MISUSE, SALE OR FABRICATIONS OF PRODUCTS WHICH DO NOT CONFORM TO THE TERMS AND CONDITIONS OF THE CONTRACT.

The information contained herein is provided to the user as a convenience. While every effort has been made to ensure accuracy, ID TECH is not responsible for damages that might occur because of errors or omissions, including any loss of profit or other commercial damage, nor for any infringements or patents or other rights of third parties that may result from its use. The specifications described herein were current at the time of publication, but are subject to change at any time without prior notice.

Revision History

Revision	Date	Description	By
A	05/05/2010	Initial Release	Jenny W
A1	06/14/2010	Added RS232 interface	Jenny W
A2	06/16/2010	General edits and modified Appendix A	Jenny W
A3	06/25/2010	Updated reader command summary	Jenny W
A4	06/28/2010	Updated reader command. - Added Set Reader Options and Get Reader Options command	Jenny W
A5	06/29/2010	Added level 4 security features to demo software section	Jenny W
A6	07/21/2010	- Modified commands for Key Loading - Removed commands for Enter/Quit Key Loading mode as they are no longer being supported	Jenny W
A7	09/07/2010	Added original and enhanced security structures and descriptions	Bruce K
A8	09/07/2010	Added PS2 interface	Jimmy W
A9	09/10/2010	- Updated demo software screenshots. - Revised data format information. - General edits.	Jenny W
B	09/24/2010	- Added decryption example for level 3 and 4 original and enhanced encryption format. - Revised to include more detailed explanations on the command format and security features	Jenny W
C	05/02/2011	- Edited original and enhanced encryption output format - Added more info in Section 10 Data Output.	Jenny W

1. Introduction

ID TECH SecureMag reader delivers superior reading performance with the ability to encrypt sensitive card data. The data encryption process prevents card holder information from being accessed when the data is stored or in transit, so the data remains secure from end to end. The reader fully supports TDES and AES data encryption using DUKPT key management method. The SecureMag is offered in USB, RS232 as well as PS2 interfaces.

2. Features and Benefits

- Bi-directional card reading
- Reads encoded data that meets ANSI/ISO/AAMVA standards and some custom formats such as ISO track 1 format on track 2 or 3
- Reads up to three tracks of card data
- A LED and a beeper on the reader provide status of the reading operations
- Compatible with USB specification Revision 2.0 (USB interface)
- Compatible with HID specification Version 1.1 (USB interface)
- Uses standard Windows HID driver for communications; no third party device driver is required (USB interface)
- Provides clear text confirmation data including card holder's name and a portion of the PAN as part of the Masked Track Data
- User friendly configuration software for device configuration

Note: many unusual words used in this document are defined in the Function ID table on page.

4. Applicable Documents

ISO 7810 – 1985	Identification Cards – Physical
ISO 7811 - 1 through 6	Identification Cards - Track 1 through 3
ISO 7816 - 1 through 4	Identification Cards - Integrated circuit cards with contacts
ISO 4909	Magnetic stripe content for track 3
ISO 7812	Identification Cards – Identification for issuers Part 1 & 2
ISO 7813	Identification Cards – Financial Transaction Cards
ANSI X.94	Retail Financial Services Symmetric Key Management

5. Operation

A card may be swiped through the reader slot when the LED is green. The magnetic stripe must face toward the magnetic read head and may be swiped in either direction. After a card is swiped, the LED will turn off temporarily until the decode process is completed. If there are no errors decoding the card data then the LED will turn green. If there are any errors decoding the card data, the LED will turn red for less than one second to indicate that an error occurred and then turn green.

The reader LED will be off during the data transfer and is ready to read another card when the LED returns to green. A red LED indicates an error and the beeper will also provide error indications. The beeper will beep for each correctly read track of data on the magstripe card. Depending on the security level configured, the card data might be displayed in clear or encrypted mode.

6. Specification

Power Consumption

- 5VDC +/- 10%
- Maximum operating current consumption less than 50mA
- RS232 interface – external power adaptor supplies power through RS232 cable
- USB interface – from host interface. No external power adaptor needed.

Swipe speed

- 3 to 65 inches per second
- Bi-directional

Indicators

- Tri-color LED
 - Red indicates bad read
 - LED off while reading and decoding
 - Green indicates good read, and ready to read
- Beeper
 - A beep sound indicates good read

Communication Interface

- RS232
 - Baud Rate – 1200, 2400, 4800, 9600, 19200, 38400, 56700, 115200
 - Data bits – 8
 - Stop bits – 1 or 2
 - Parity – off, odd, even, mark or space
 - Supports RTS/CTS hardware and Xon-Xoff software handshaking
- USB
 - Complies with USB 2.0 specification
- PS2 Keyboard
 - IBM PS2 interface compatible

Card Size

- Supports cards that meets the ISO 7810 and 7811 1-7 standards

Dimension

- 3.94 inches (length) by 1.38 inches (width) and 1.18 inches (height).

Interface cable and connector

- RS232 interface
 - IDT standard RS232 Interface Cable
 - DB-9 Female connector with 2mm power jack in the housing
 - Standard cable length is 6 feet
 - Pin Out Table

J1*	Color	Signal	P1*
1	-	CASE_GND	SHELL
2	White	TXD	2
3	Green	RXD	3
4	Yellow	VCC	from power jack
5	Brown	RTS	8**
6	Grey	CTS	4**
7	Black	GND	5

*J1 is the connector to PCB end and P1 is DB-9 end

** RTS and CTS are not used unless hardware handshaking support is enabled by Function ID 0x44 (Handshake)

- USB
 - IDT standard USB interface cable
 - Series “A” plug
 - Standard cable length is 6 feet
 - Pin Out Table

J1	Color	Signal	P1
1	-	CASE_GND	SHELL
3	GRN	+DATA	3
5	Red	V_IN	1
6	White	-DATA	2
7	BLK	GND	4

- Keyboard wedge
 - IDT standard Keyboard Wedge cable
 - Y cable with dual PS/2 6-pin mini-DIN connectors; male side is connected to PC, female side connected to KB.
 - Standard cable length is 6 feet
 - Pin Out Table

J1	Color	Signal	J2	J3
1	-	CASE_GND	SHELL	SHELL
2	White	P-CLK	5	--
3	Green	P-DATA	1	--
4	Yellow	VCC	4	4
5	Brown	K-CLK	--	5
6	Grey	K-DATA	--	1
7	Black	GND	3	3

PS/2 Connector

LED indicator

- 2mmx5mm, Green/Red dual color under firmware control

7. Command Process

Command requests and responses are sent to and received from the device. For USB interface devices, the commands are sent to the device using HID class specific request Set_Report (21 09 ...). The response to a command is retrieved from the device using HID class specific request Get_Report (A1 01 ...). These requests are sent over the default control pipe. For RS232 interface devices, please see the commands listed below.

Function ID Table

The complete table of Function ID used in command/response are listed in Appendix A.

Setting Command

The setting data command is a collection of many function setting blocks and its format is as follows.

Command:

<STX><S><FuncSETBLOCK1>...<FuncBLOCKn><ETX><LRC>

Response: <ACK> or <NAK> for wrong command (invalid funcID, length and value)

Each function-setting block <FuncSETBLOCK> has following format:

<FuncID><Len><FuncData>

Where:

<FuncID> is one byte identifying the setting(s) for the function.

<Len> is the length count for the following function-setting block <FuncData>.

<FuncData> is the current setting for this function. It has the same format as in the sending command for this function.

Get Setting Command

This command will send current setting to application.

Command: <STX> <R> <FuncID> <ETX> <LRC 1>

Response: <ACK> <STX> <FuncID> <Len> <FuncData> <ETX> <LRC 2>

<FuncID>, <Len> and <FuncData> definition are same as described above.

Where:

Characters	Hex Value	Description
<STX>	02	Start of Text
<ETX>	03	End of Text
<ACK>	06	Acknowledge
<NAK>	15 for	Negative Acknowledge

SecureMag User Manual

	RS232 and USB HID interface; FD for USB KB interface	
<UnknownID>	16	Warning: Unsupported ID in setting
<AlreadyInPOS>	17	Warning: Reader already in OPOS mode
<R>	52	Review Setting
<S>	53	Send Setting
<LRC>	-	Xor'd all the data before LRC.

Reader Command Summary

ASCII	HEX	Name	Use
'8'	38	Copyright Report	Requests reader's copyright notice
'9'	39	Version Report	Requests version string
'F'	46	Key Loading	Special command to load encryption keys
'I'	49	Reader Reset	Reset the reader. Software reset does not resend startup string
'M'	4D	OPOS/ JPOS Command	Command to enter OPOS or JPOS mode
'P'	50	Arm/Disarm to Read	Arm to Capture Buffer Mode MSR
'Q'	51	Read Buffered Data	Read Stored MSR Data
'R'	52	Read MSR Options	Read various reader optional settings
'S'	53	Set MSR Options	Set various reader optional functions

Notation used throughout the document:

Bold: boldface font indicates default setting value

'2': single quotation indicates ASCII characters, for example, '2' is 32 in hex

"Number": a null terminated character string

<Len>: angle brackets indicate a specific character or character string in a command or response

Hex: the hex character 53 is '5' in ASCII or 83 in decimal. Sometimes hex characters are represented with an *h* attached to the end, for example, 53h.

\02: is a way to show that the following number is in hex. It is used by the configuration program.

7.1 Get Copyright Information

02 38 03 39

A '31-byte' Copyright Notice will be returned.

Copyright © 2010, International Technologies & Systems Corp. All rights reserved.

Response is as follows:

ACK STX <Copyright String> ETX LRC

Response Example mixed hex and ASCII:

\06\02Copyright (c) 2010, ID TECH \03>

7.2 Version Report Command

02 39 03 38

Response is as follows:

ACK STX<Version String> ETX LRC

Response Example mixed hex and ASCII:

\06\02ID TECH TM3 SecureMag RS232 Reader V 3.19\03\LRC

7.3 Key Loading Command

Note: This command is normally only used by a key loading facility.

The Encrypted swipe read supports TDES and AES encryption standards for data encryption. Encryption can be turned on via a command. TDES is the default.

If the reader is in security level 3, for the encrypted fields, the original data is encrypted using the TDES/AES CBC mode with an Initialization Vector starting at all binary zeroes and the Encryption Key associated with the current DUKPT KSN.

KSN and Device Key loading commands and responses protocol:

When DUKPT key management is used, it is necessary to load Key Serial Number (KSN) and Initially Loaded Device Key before transaction.

The encryption key is TDES with 128 bit keys or AES encryption with double length keys (128 bit keys including parity).

KSN and Device Key loading commands and responses protocol:

Command:

<STX><'F'><'F'><Command Data (BASE64)><0x0D><0x0A><ETX><LRC>

Response:

<ACK/NAK><STX><'F'><'F'>< Respond Data(BASE64)><0x0D><0x0A><ETX><LRC>

STX: 0x02

ETX: 0x03

ACK: 0x06

NAK: 0x15

BASE64: Data encoded with base64 algorithm

LRC: Xor'd all the data before LRC.

SecureMag User Manual

A successful key loading process includes the following steps:

- Get Key status

Command Data: <FF><13><01><02><LRC>

Response Data: <FF><00><01><04><LRC>

For Example:

Command: \02\46\46\2F\78\4D\42\41\75\38\3D\0D\0A\03\LRC

Response: \06\02\46\46\.....\0D\0A\03\LRC

- Load KSN

Command Data: <FF><0A><11><KSN#><KSN bytes><LRC>

Response Data: <FF><00><06><RESPONSE CODE><LRC>

<KSN#>: TDES: 0x32 DES: 0x0A

<KSN bytes>: 16 bytes ASCII for KSN

<RESPONSE CODE>: 6 bytes data in ASCII format which is converted from the first 3 cipher hex data. These cipher data are generated by encrypting KSN bytes and "00 00 00 00 00 00 00 00".

For Example:

Command:

\02\46\46\2F\77\6F\52\4D\6B\5A\47\52\6B\59\35\4F\44\63\32\4E\54\51\7A\4D\6A\45\77\52\54\43\69\0D\0A\03\5D

Response: \06\02\46\46\.....\0D\0A\03\LRC

- Load Encryption Key

Command Data: <FF><0A><LENGTH><KEY#><KEY bytes><LRC>

Response Data: <FF><00><06><RESPONSE CODE><LRC>

<LENGTH>: TDES: 0x21 DES: 0x11

<KEY#>: TDES: 0x33 DES: 0x0B

<KEY bytes>: TDES: 0x20 DES: 0x10

<RESPONSE CODE>: 6 bytes data in ASCII format which is converted from the first 3 cipher hex data. These cipher data are generated by encrypting KEY bytes and "00 00 00 00 00 00 00 00".

For Example:

Command:

\02\46\46\2F\77\6F\68\4D\7A\5A\42\51\7A\49\35\4D\6B\5A\42\51\54\45\7A\4D\54\56\43\4E\45\51\34\4E\54\68\42\51\6A\4E\42\4D\30\51\33\52\44\55\35\4D\7A\4E\42\6C\51\3D\3D\0D\0A\03\2D

Response: \06\02\46\46\.....\0D\0A\03\LRC

7.4 Reader Reset Command

02 49 03 48

The reader supports a reset reader command. This allows the host to return the reader to its default state.

Response is as follows:

06

7.5 OPOS/JPOS Command

There are three forms of the command:

02 4D 01 30 03 7D	Enter Standard Mode (Exit OPOS Mode)
02 4D 01 31 03 7C	Enter OPOS Mode
02 4D 01 32 03 7F	Enter JPOS Mode

Response is as follows:

17	Reader already in OPOS Mode
15	Command failure (wrong length or wrong parameter)
06	Success

7.6 Arm/Disarm to Read Command

Arm to read:

02 50 01 30 03 LRC

This command enables the MSR to be ready for a card swipe in buffered mode.

Any previously read data will be erased and reader will wait for the next swipe.

As the user swipes a card, the data will be saved, but will not be sent to the host. The reader holds the data until receiving the next “Arm to Read” or “MSR Reset” command.

Disarm to read:

02 50 01 32 03 LRC

This command will disable MSR read and clear any magnetic data in buffered mode. The reader enters to a disarmed state and will ignore MSR data.

Response is as follows:

06

Other possible response statuses:

NAK	'P' command length must be 1
NAK	'P' command must be 0x30 or 0x32
NAK	Reader not configured for buffered mode
NAK	Reader not configured for magstripe read

NAK for keyboard interface is FD, non-KB mode NAK is 15

7.7 Read Buffered MSR Data Command

02 51 01 <Track Selection Option> 03 LRC

The <Track Select Option> byte is defined as follows:

- '0' Any Track
- '1' Track 1
- '2' Track 2
- '3' Track 1 and Track 2
- '4' Track 3
- '5' Track 1 and Track 3
- '6' Track 2 and Track 3
- '7' Track 1, Track 2 and Track 3
- '8' Track 1 and/ or Track 2
- '9' Track 2 and/ or Track 3

This command requests card data information for the buffered mode.

The selected MSR data is sent to the host with or without envelope format, according to the operation mode setting.

This command does not erase the data.

Response is as follows:

06 02 <Len_H> <Len_L> <MSR Data> 03 LRC

Other possible response statuses:

- 18 'Q' command length must be 1
- 18 Reader not configured for buffered mode
- NAK Already armed

NAK for keyboard interface is FD, non-KB mode NAK is 15

7.8 Read MSR Options Command

02 52 1F 03 LRC

<Response> format:

The current setting data block is a collection of many function-setting blocks

<FuncSETBLOCK> as follows:

<STX><FuncSETBLOCK1>...<FuncSETBLOCKn><ETX><Checksum>

Each function-setting block <FuncSETBLOCK> has the following format:

<FuncID><Len><FuncData>

Where:

<FuncID> is one byte identifying the setting(s) for the function.
<Len> is a one byte length count for the following function-setting block <FuncData>
<FuncData> is the current setting for this function. It has the same format as in the sending command for this function.
<FuncSETBLOCK> are in the order of their Function ID<FuncID>

7.9 Set MSR Options Command

The default value is listed **in bold**.

7.9.1. Beep Volume

The beep volume and frequency can be each adjusted to two different levels, or turned off.

02 53 11 01 <Beep Settings>03 LRC

Beep Settings:

- '0' for beep volume off
- '1' for beep volume high, low frequency
- '2' for beep volume high, high frequency**
- '3' for beep volume low, high frequency
- '4' for beep volume low, low frequency

7.9.2. Change to Default Settings

02 53 18 03 LRC

This command does not have any <FuncData>. It returns all non-security settings for all groups to their default values.

7.9.3. MSR Reading Settings

02 53 1A 01<MSR Reading Settings> 03 LRC

MSR Reading Settings:

- '0' MSR Reading Disabled
- '1' MSR Reading Enabled**

7.9.4. Decoding Method Settings

02 53 1D 01<Decoding Method Settings> 03 LRC

Decoding Method Settings:

- '0' Raw Data Decoding in Both Directions
- '1' Decoding in Both Directions**
- '2' Moving stripe along head in direction of encoding
- '3' Moving stripe along head against direction of encoding

With the bi-directional method, the user can swipe the card in either direction and still read the data encoded on the magnetic stripe. Otherwise, the card can only be swiped in one specified direction to read the card. Raw Decoding just sends the card's magnetic data in groups of 4 bits per character. No checking is done except to verify track has or does not have magnetic data.

7.9.5. Terminator Setting

Terminator characters are used to end a string of data in some applications.

02 53 21 01 <Terminator Settings> 03 LRC

<Terminator Settings>

Any one character, 00h is none; default is **CR** (0Dh).

7.9.6. Preamble Setting

Characters can be added to the beginning of a string of data. These can be special characters for identifying a specific reading station, to format a message header expected by the receiving host, or any other character string. Up to fifteen ASCII characters can be defined.

02 53 D2 <Len><Preamble> 03 LRC

Where:

Len = the number of bytes of preamble string

Preamble = {string length} {string}

NOTE: String length is one byte, maximum fifteen <0Fh>.

7.9.7. Postamble Setting

The postamble serves the same purpose as the preamble, except it is added to the end of the data string, after any terminator characters.

02 53 D3 <Len><Postamble> 03 LRC

Where:

Len = the number of bytes of postamble string

Postamble = {string length} {string}

NOTE: String length is one byte, maximum fifteen <0Fh>.

7.9.8. Track n Prefix Setting

Characters can be added to the beginning of a track data. These can be special characters to identify the specific track to the receiving host, or any other character string. Up to six ASCII characters can be defined.

02 53 <n><Len><Prefix> 03 LRC

Where:

n is 34h for track 1; 35h for track 2 and 36h for track 3

Len = the number of bytes of prefix string

Prefix = {string length} {string}

NOTE: String length is one byte, maximum six.

7.9.9. Track x Suffix Setting

Characters can be added to the end of track data. These can be special characters to identify the specific track to the receiving host, or any other character string. Up to six ASCII characters can be defined.

02 53 <n><Len><Suffix> 03 LRC

Where:

n is 37h for track 1; 38h for track 2 and 39h for track 3

Len = the number of bytes of suffix string

Suffix = {string length} {string}

NOTE: String length is one byte, maximum six.

7.9.10. Track Selection

There are up to three tracks of encoded data on a magnetic stripe.

This option selects the tracks that will be read and decoded.

02 53 13 01 <Track_Selection Settings> 03 LRC

<Track_Selection Settings>

'0' Any Track

'1' Require Track 1 Only

'2' Require Track 2 Only

'3' Require Track 1 & Track 2

'4' Require Track 3 Only

'5' Require Track 1 & Track 3

'6' Require Track 2 & Track 3

'7' Require All Three Tracks

'8' Any Track 1 & 2

'9' Any Track 2 & 3

Note: If any of the required multiple tracks fail to read for any reason, no data for any track will be sent.

7.9.11.Track Separator Selection

This option allows the user to select the character to be used to separate data decoded by a multiple-track reader.

02 53 17 01 <Track_Separator> 03 LRC

<Track_Separator> is one ASCII Character.

The default value is CR, 0h means no track separator.

7.9.12.Start/End Sentinel and Track 2 Account Number Only

The SecureMag can be set to either send, or not send, the Start/End sentinel, and to send either the Track 2 account number only, or all the encoded data on Track 2. (The Track 2 account number setting doesn't affect the output of Track 1 and Track 3.)

02 53 19 01 <SendOption> 03 LRC

<SendOption>

'0' Don't send start/end sentinel and send all data on Track 2

'1' Send start/end sentinel and send all data on Track 2

'2' Don't send start/end sentinel and send account # on Track 2

'3' Send start/end sentinel and send account number on Track 2

8. Security Features

The reader features configurable security settings. Before encryption can be enabled, Key Serial Number (KSN) and Base Derivation Key (BDK) must be loaded before encrypted transactions can take place. The keys are to be injected by certified key injection facility.

There are five security levels available on the reader as specified in the followings:

- **Level 0**
Security Level 0 is a special case where all DUKPT keys have been used and is set automatically when it runs out of DUKPT keys. The lifetime of DUKPT keys is 1 million. Once the key's end of life time is reached, user should inject DUKPT keys again before doing any more transactions.
- **Level 1**
By default, readers from the factory are configured to have this security level. There is no encryption process, no key serial number transmitted with decoded data. The reader functions as a non-encrypting reader and the decoded track data is sent out in default mode.
- **Level 2**
Key Serial Number and Base Derivation Key have been injected but the encryption process is not yet activated. The reader will send out decoded track data in default format. Setting the encryption type to TDES and AES will change the reader to security level 3.
- **Level 3**
Both Key Serial Number and Base Derivation Keys are injected and encryption mode is turned on. For payment cards, both encrypted data and masked clear text data are sent out. Users can select the data masking of the PAN area; the encrypted data format cannot be modified. Users can choose whether to send hashed data and whether to reveal the card expiration date.
- **Level 4**
When the reader is at Security Level 4, a correctly executed Authentication Sequence is required before the reader sends out data for a card swipe. Commands that require security must be sent with a four byte Message Authentication Code (MAC) at the end. Note that data supplied to MAC algorithm should NOT be converted to ASCII-Hex, rather it should be supplied in its raw binary form. Calculating MAC requires knowledge of current DUKPT KSN, this could be retrieved using Get DUKPT KSN and Counter command.

Default reader properties are configured to have security level 1 (no encryption). In order to output encrypted data, the reader has to be key injected with encryption feature enabled. Once the reader has been configured to security level 2, 3 or 4, it cannot be reverted back to a lower security level.

8.1 Encryption Management

The Encrypted swipe read supports TDES and AES encryption standards for data encryption. Encryption can be turned on via a command. TDES is the default.

If the reader is in security level 3, for the encrypted fields, the original data is encrypted using the TDES/AES CBC mode with an Initialization Vector starting at all binary zeroes and the Encryption Key associated with the current DUKPT KSN.

8.2 Check Card Format

- ISO/ABA (American Banking Association) Card (card type 0)
Encoding method
Track1 is 7 bits encoding.
Track1 is 7 bits encoding. Track2 is 5 bits encoding. Track3 is 5 bits encoding.
Track1 is 7 bits encoding. Track2 is 5 bits encoding.
Track2 is 5 bits encoding.
Additional check
Track1 2nd byte is 'B'.
There is only one '=' in track 2 and the position of '=' is between 12th ~ 20th character.
Total length of track 2 should above 21 characters.
- AAMVA (American Association of Motor Vehicle Administration) Card
Encoding method
Track1 is 7 bits encoding. Track2 is 5 bits encoding. Track3 is 7 bits encoding.
- Others (Customer card)

8.3 MSR Data Masking

For ABA Card Data (Card Type 0)

For cards need to be encrypted, both encrypted data and clear text data are sent.

Masked Area

The data format of each masked track is ASCII.

SecureMag User Manual

The clear data include start and end sentinels, separators, first N, last M digits of the PAN, card holder name (for Track1).

The rest of the characters should be masked using mask character.

Set PrePANClrData (N), PostPANClrData (M), MaskChar (Mask Character)
N and M are configurable and default to 4 first and 4 last digits. They follow the current PCI constraints requirements (N 6, M 4 maximum). Mask character default value is '*'.

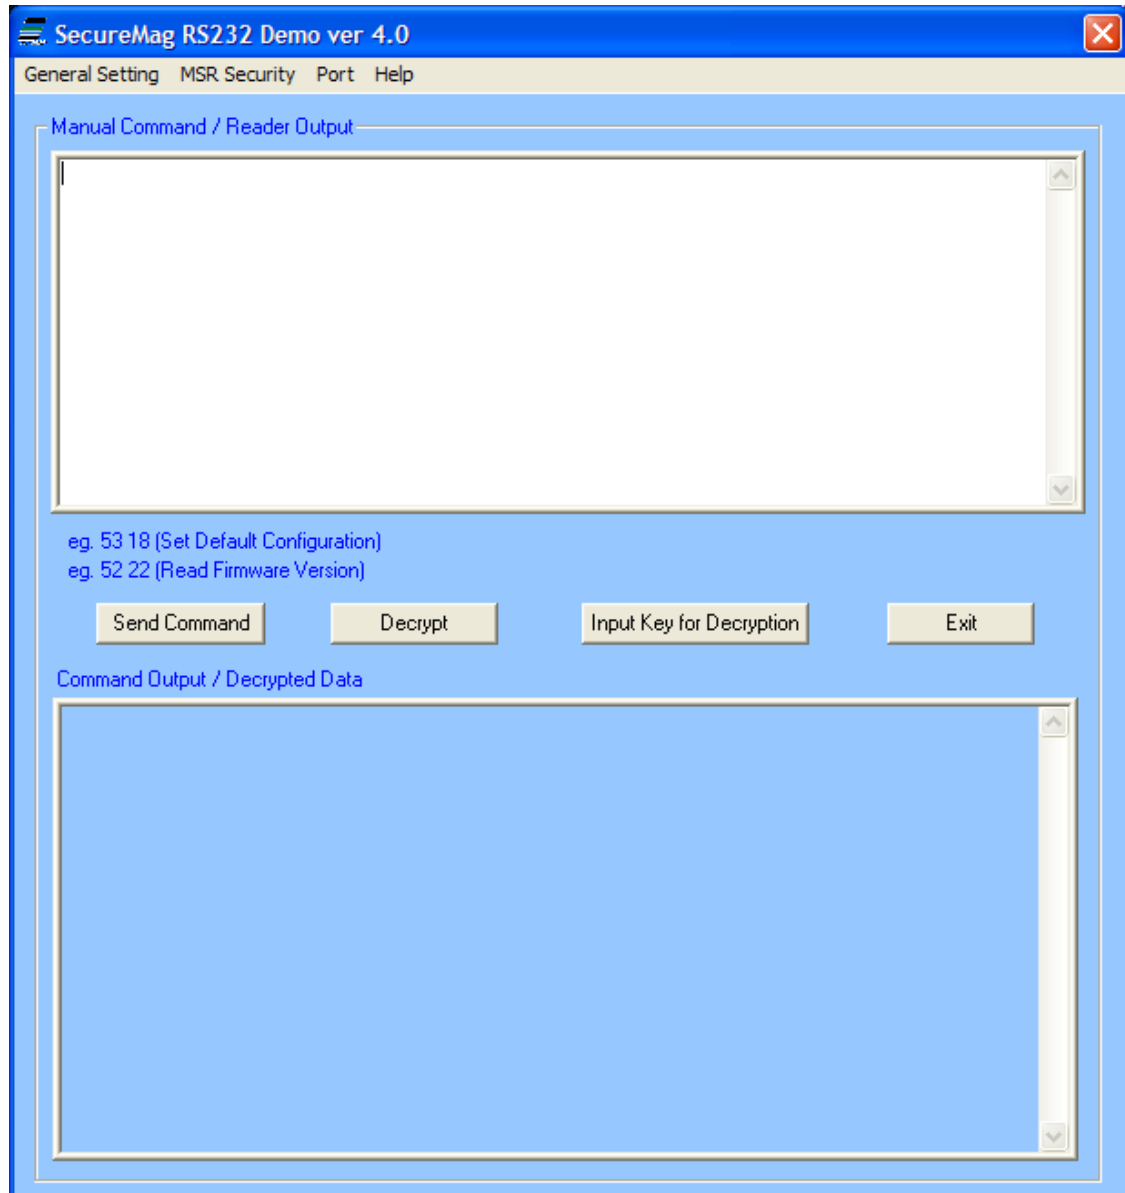

- Set PrePANClrDataID (N), parameter range 00h ~ 06h, default value 04h
- Set PostPANClrDataID (M), parameter range 00h ~ 04h, default value 04h
- MaskCharID (Mask Character), parameter range 20h ~ 7Eh, default value 2Ah
- DisplayExpirationDataID, parameter range '0'~'1', default value '0'

9. Using the Demo Program

ID TECH SecureMag Demo is provided to demonstrate features of the Encrypted MSR. It supports decrypting the encrypted data and sending command to MSR.

Overview of SecureMag Demo

Screenshot of RS232 Demo Software

The demo software is similar for each interface with exception of interface- specific settings.

9.1 Manual Command

The demo software allows users to manually input and send commands to the device. Type the <Command Data> in the field, and the command will be sent

Command will be sent out in the following structure:

<STX> <Command_Data> <ETX> <LRC>

where:

<STX> = 02h, <ETX> = 03h.

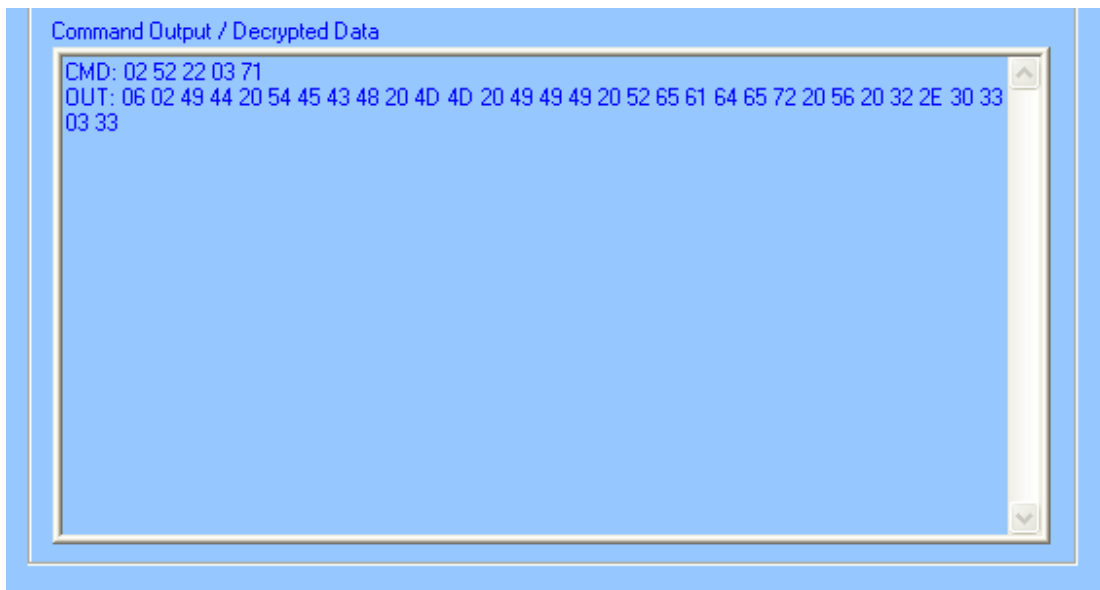

<Command_Data> : Please refer to Appendix A for a complete list of commands

<LRC> is a one byte Xor value calculated for the above data block from <STX> to <ETX>.

eg. 02 53 18 03 4A (Set Default Configuration)

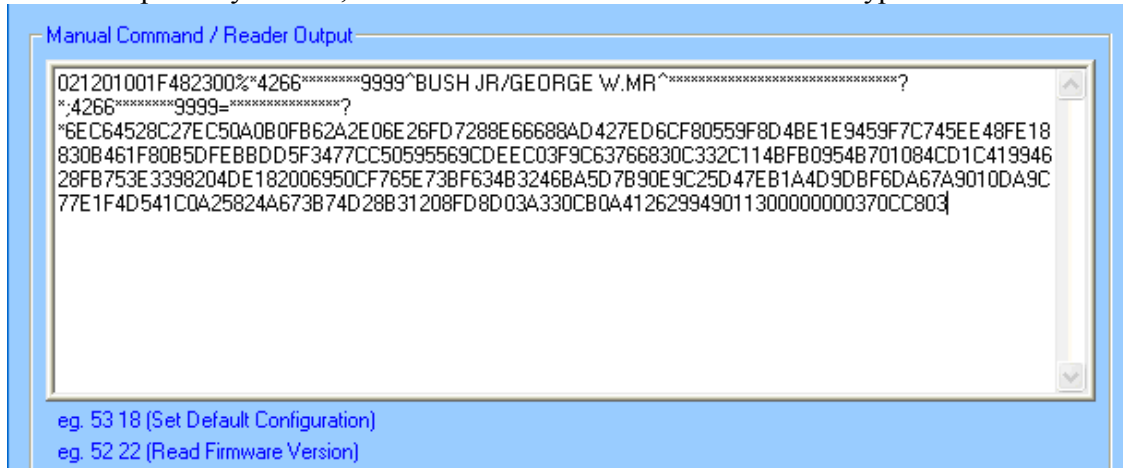

eg. 02 52 22 03 71 (Read Firmware Version)

Press “Send Command”, the input and output would be shown in the lower text box.

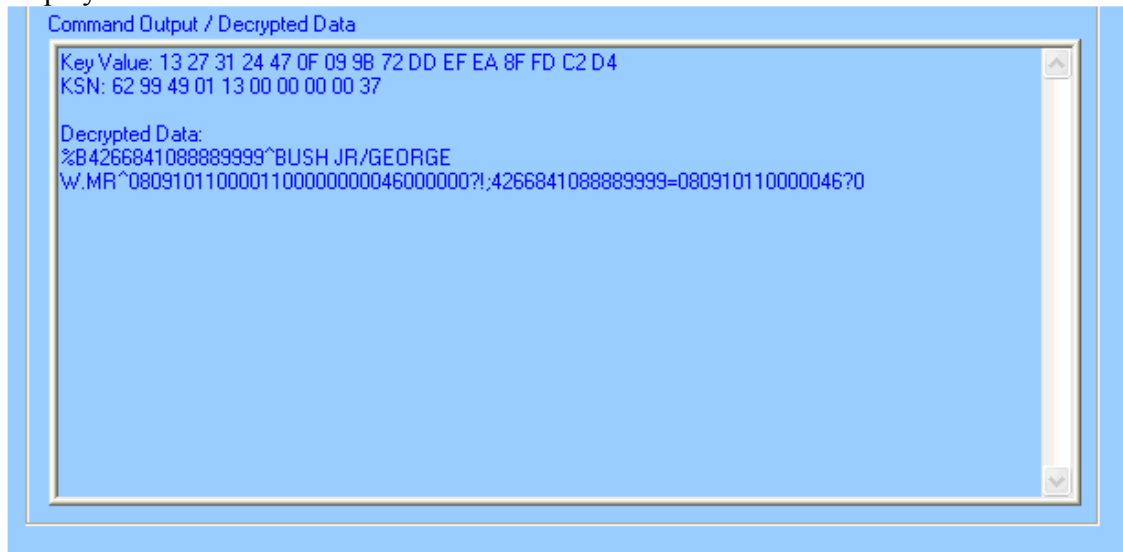

9.2 Decryption

The encrypted data will show in the Manual Command / Encrypted Data textbox after a card is swiped. By default, the cursor is in Manual Command / Encrypted Data textbox

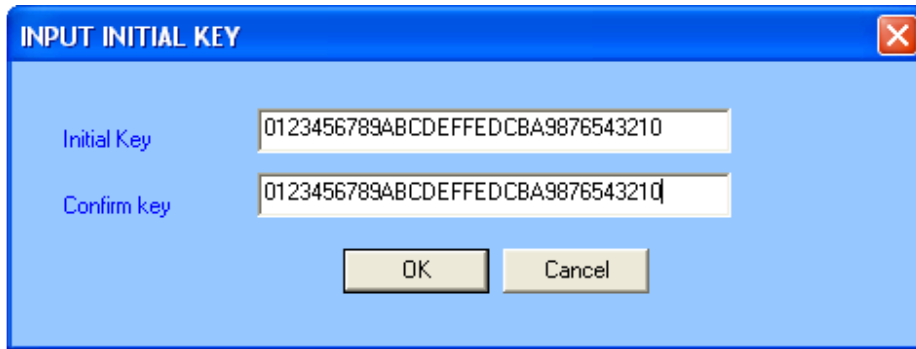

To get the decrypted data, press the “Decrypt” button and the decrypted card data will be displayed in the lower box.

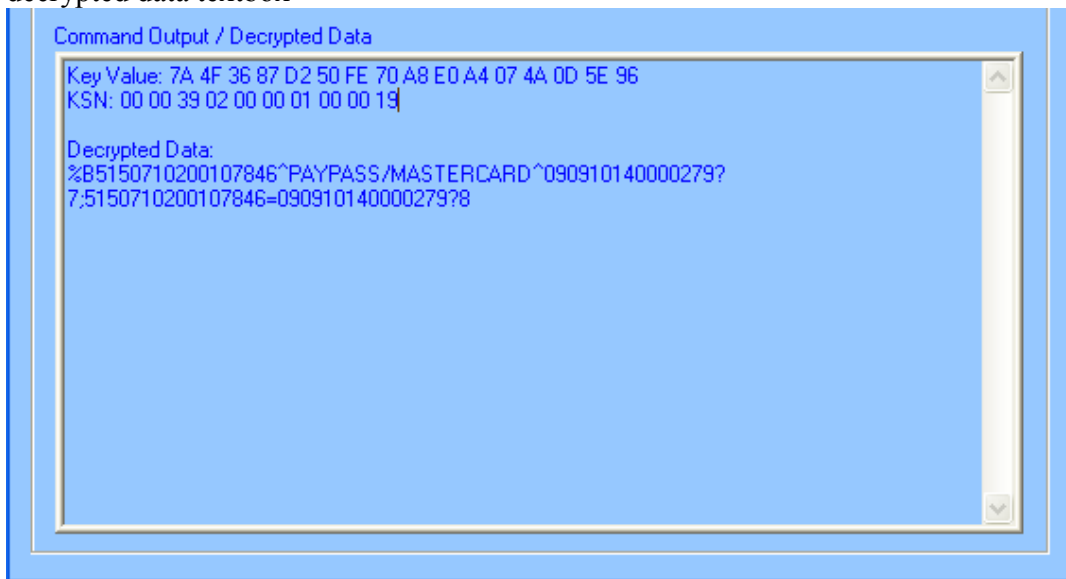

The default initial key is 0123456789ABCDEFEDCBA9876543210. If the reader is programmed with a user-defined key, load the same key to the demo software by pressing the “Input Initial Key” button. Type the initial key in the box, and press OK when finished.

SecureMag User Manual

A dialog box titled "INPUT INITIAL KEY" with a close button in the top right corner. It contains two text input fields. The first field is labeled "Initial Key" and contains the alphanumeric string "0123456789ABCDEFEDCBA9876543210". The second field is labeled "Confirm key" and contains the same string "0123456789ABCDEFEDCBA9876543210". Below the fields are two buttons: "OK" and "Cancel".

The Key Value, KSN and Decrypted Data will be shown in the command output/decrypted data textbox

A window titled "Command Output / Decrypted Data" with a scrollable text area. The text area contains the following output:

```
Key Value: 7A 4F 36 87 D2 50 FE 70 A8 E0 A4 07 4A 0D 5E 96
KSN: 00 00 39 02 00 00 01 00 00 19

Decrypted Data:
%B5150710200107846^PAYPASS/MASTERCARD^090910140000279?
7;5150710200107846=090910140000279?8
```

9.3 Reader Operations

The demo software can be used to display the card data and send reader commands. To view the card data on screen, place the cursor in the “manual command/ reader output” text box and swipe the card. To send a reader command, type the appropriate command in the text box and press the “Send Command” button.

General Setting

Provide options such as reader default settings, firmware version, beeper options, and buffered mode options. For USB demo software, there are options to set the reader to USB KB or USB HID mode.

MSR Security

The security is enabled by selecting TDES or AES. Once the encryption is enabled the reader cannot be changed back to non-encrypted mode.

Port/ Settings

RS232 interface: select Com port and open/ close port.

USB KB interface: set KB polling interval and select language settings

Help

Provides version information of the demo software.

10. Data Format

The USB version of the reader can be operated in two different modes:

- HID ID TECH mode (herein referred to as “**HID** mode”), Product ID: 2010
- HID with Keyboard Emulation (herein referred to as “**KB** mode”), Product ID: 2030

When the reader is operated in the HID mode, it behaves like a vendor defined HID device. A direct communication path can be established between the host application and the reader without interference from other HID devices.

10.1 Level 1 and level 2 Standard Mode Data Output Format

USB HID Output Format

Card data is only sent to the host on the Interrupt In pipe using an Input Report. The reader will send only one Input Report per card swipe. If the host requests data from the reader when no data is available, the reader will send a NAK to the host to indicate that it has nothing to send.

10.1.1. USB HID Data Format

Other Mode Reader Data Structure

<u>Offset</u>	<u>Usage Name</u>
0	T1 decode status
1	T2 decode status
2	T3 decode status
3	T1 data length
4	T2 data length
5	T3 data length
6	Card encode type
7-116	T1 data
117-226	T2 data
227-336	T3 data

Notes:

T1, T2 or T3 decode status: 0 for no error, 1 for error

T1, T2 or T3 Data Length: Each byte value indicates how many bytes of decoded card data are in the track data field. This value will be zero if there was no data on the track or if there was an error decoding the track.

Card Encode Type:

<u>Value</u>	<u>Encode Type</u>	<u>Description</u>
0	ISO/ABA	ISO/ABA encode format
1	AAMVA	AAMVA encode format
3	Other	The card has a non-standard format. For example, ISO/ABA track 1 format on track 2
4	Raw	The card data is sent in Raw encrypted format. All tracks are encrypted and no mask data is sent

T1, T2 or T3 data: The length of each track data field is fixed at 110 bytes, but the length of valid data in each field is determined by the track data length field that corresponds to the track number. The track data includes all data string starting with the start sentinel and ending with the end sentinel.

ID TECH Reader Data Structure

<u>Offset</u>	<u>Usage Name</u>
0	T1 decode status
1	T2 decode status
2	T3 decode status
3	T1 data length
4	T2 data length
5	T3 data length
6	Card encode type

SecureMag User Manual

7,8 Total Output Length
 9-512 Output Data

In this approach, the reader will keep all of the ID TECH data editing and other features like preamble, postamble, etc. The output data is always 512 bytes; the "Total Output Length" field indicates the valid data length in the output data

10.2 Level 1 and level 2 POS Mode Data Output Format

In POS mode use the special envelope to send out card data, envelope is in the following format:

SecureMag User Manual

[Right Shift, Left Shift, Right Ctrl, Left Ctrl,] Read Error, Track x ID; Track x Error; Track x Data Length; Track x Data; Card Track x LEC code; Track x data LRC.

Reader will send out card data in Alt mode if its ASCII code less than H'20'.

Byte NO.	Name
0	Right Shift
1	Left Shift
2	Right Ctrl
3	Left Ctrl
4	Read Error 1
5	Read Error 2
6	Track x ID
7	Track x Error
8	Track x Length 1
9	Track x Length 2
10	Track Data (no extra Track ID for raw data)
	...
10 + Track len -1	Card Track x LRC
10 + Track len	Track x LRC
10 + Track len +1	0x0D
10 + Track len + 2	Track x ID
....	Repeat Track

The data format is independent with MSR setting. No Track x data if track x sampling data does not exist.

OPOS header:

Only HID KB interface has [Right Shift, Left Shift, Right Ctrl, Left Ctrl] under POS mode.

Read Error:

Read Error 1 byte bits:

MB

LB

0	B6	B5	B4	B3	B2	B1	B0
B0	1: Track 1 sampling data exists (0: Track 1 sampling data does not exist)						
B1	1: Track 2 sampling data exists (0: Track 2 sampling data does not exist)						
B2	1: Track 3 sampling data exists (0: Track 3 sampling data does not exist)						
B3	1: Track 1 decode success (0: Track 1 decode fail)						
B4	1: Track 2 decode success (0: Track 2 decode fail)						
B5	1: Track 3 decode success (0: Track 3 decode fail)						
B6	0: if b0 to b5 are all 1, otherwise 1 (make it printable)						

SecureMag User Manual

Read Error byte 2:

MB		LB					
0	1	B12	B11	B10	B9	B8	B7

B7 1: Track 4 sampling data exists (0: Track 4 sampling data does not exist)

B8 1: Track 4 JIS II decode success (0: Track4 JIS II decode fail)

B9, B10, B11

000: ISO Card (7, 5) or (7, 5, 5) encoding

001: Old CADL Card (6, 5, 6) encoding (no longer included)

010: AAMVA Card (7, 5, 7) encoding

011: JIS I Card (8, 5, 8) encoding

100: JIS II card (8) or ISO+JIS II

110: OPOS Raw Data Output

111: JIS I + JIS II

B12 Reserved for future use

Decode flag will set to 1 (B3, B4 and B5 all set to 1) in OPOS raw data mode.

Track ID

Track ID is a byte of ID, it will be '1', '2' and '3' for track 1, 2 and 3; it is not accurate to use start sentinel to identify track.

Track x Error

Track x error is a byte of flags, it will be in format of: 0 0 1 b4, b3, b2 b1 b0

b0 1: Start sentinel error (0: Not start sentinel error)

b1 1: End sentinel error (0: Not end sentinel error)

b2 1: Parity error (0: Not parity error)

b3 1: LRC error (0: Not LRC error)

b4 1: Other error (0: Not other error)

Track x Error is set to 0x20 in OPOS raw data mode.

Track Length

Assume actual "Track x Data Length" is hex code xy; the Track x data length for OPOS mode output will be hex code 3x, 3y.

Track x data length does not include the byte of "Track x data LRC", it is <30> <30> in case of read error on track x.

Track Data

"Card Track x LRC code" is track x card data.

Track x LRC

"Track x data LRC" is a LRC to check track x data communication; XOR all characters start from "Track x ID" to "Track x data LRC" should be 0.

10.3 DUKPT Level 3 Data Output Enhanced Format

This mode is used when all tracks must be encrypted, or encrypted OPOS support is required, or when the tracks must be encrypted separately or when cards other than type 0 (ABA bank cards) must be encrypted or when track 3 must be encrypted. This format is the standard encryption format, but not yet the default encryption format.

1. Encryption Output Format Setting:

Command: 53 85 01 <Encryption Format>

Encryption Format:

'00h': Original Encryption Format

'01h': Enhanced Encryption Format

2. Encryption Option Setting: (for enhanced encryption format only)

Command: 53 84 01 <Encryption Option>

Encryption Option: (**default 08h**)

bit0: 1 – track 1 force encrypt

bit1: 1 – track 2 force encrypt

bit2: 1 – track 3 force encrypt

bit3: 1 – track 3 force encrypt when card type is 0

Note:

1) When force encrypt is set, this track will always be encrypted, regardless of card type. No clear/mask text will be sent.

2) If and only if in enhanced encryption format, each track is encrypted separately. Encrypted data length will round up to 8 or 16 bytes.

3) When force encrypt is not set, the data will be encrypted in original encryption format, that is, only track 1 and track 2 of type 0 cards (ABA bank cards) will be encrypted.

3. Hash Option Setting:

Command: 53 5C 01 <Hash Option>

Hash Option: ('0' – '7')

Bit0: 1 – track1 hash will be sent if data is encrypted

Bit1: 1 – track2 hash will be sent if data is encrypted

Bit2: 1 – track3 hash will be sent if data is encrypted

4. Mask Option Setting: (for enhanced encryption format only)

SecureMag User Manual

Command: 53 86 01 <Mask Option>

Mask Option: **(Default: 0x07)**

bit0: 1 – tk1 mask data allow to send when encrypted

bit1: 1 – tk2 mask data allow to send when encrypted

bit2: 1 – tk3 mask data allow to send when encrypted

When mask option bit is set – if data is encrypted (but not forced encrypted), the mask data will be sent; If mask option is not set, the mask data will not be sent under the same condition.

Settings for OPOS:

1. Assume reader is under default setting (Encrypt Structure 0)
2. Set to new Encrypt Structure 1:
53 85 01 31

The OPOS driver/application may also send following command when change (Decode/Raw format)

(Set raw or decode data format)

53 1D 01 30 // RAW data format

53 1D 01 31 // Decoded format

Card data is sent out in the following format

<STX><LenL><LenH><Card Data><CheckLRC><Checksum><ETX>

0	STX
1	Data Length low byte
2	Data Length high byte
3	Card Encode Type ¹
4	Track 1-3 Status ²
5	Track 1 data length
6	Track 2 data length
7	Track 3 data length
8	Clear/masked data sent status ³
9	Encrypted/Hash data sent status ⁴
10	Track 1 clear/mask data
	Track 2 clear/mask data
	Track 3 clear/mask data
	Track 1 encrypted data
	Track 2 encrypted data
	Track 3 encrypted data
	Session ID (8 bytes) (Security level 4 only)

SecureMag User Manual

Track 1 hashed (20 bytes each) (if encrypted and hash track 1 allowed)
Track 2 hashed (20 bytes each) (if encrypted and hash track 2 allowed)
Track 3 hashed (20 bytes each) (if encrypted and hash track 3 allowed)
KSN (10 bytes)
CheckLRC
Checksum
ETX

Where <STX> = 02h, <ETX> = 03h

Note 1 : Card Encode Type

Card Type will be 8x for enhanced encryption format and 0x for original encryption format

<u>Value</u>	<u>Encode Type Description</u>
00h / 80h	ISO/ABA format
01h / 81h	AAMVA format
03h / 83h	Other
04h / 84h	Raw; un-decoded format

For Type 04 or 84 Raw data format, all tracks are encrypted and no mask data is sent. No track indicator '01', '02' or '03' in front of each track. Track indicator '01', '02' and '03' will still exist for non-encrypted mode.

Note 2: Track 1-3 status byte

Field 4:

Bit 0: 1— track 1 decoded data present
Bit 1: 1— track 2 decoded data present
Bit 2: 1— track 3 decoded data present
Bit 3: 1— track 1 sampling data present
Bit 4: 1— track 2 sampling data present
Bit 5: 1— track 3 sampling data present
Bit 6, 7 — Reserved for future use

Note 3: Clear/mask data sent status

Field 8 (Clear/mask data sent status) and field 9 (Encrypted/Hash data sent status) will only be sent out in enhanced encryption format.

Field 8: Clear/masked data sent status byte:

- Bit 0: 1 —track 1 clear/mask data present
- Bit 1: 1— track 2 clear/mask data present
- Bit 2: 1— track 3 clear/mask data present
- Bit 3: 0— reserved for future use
- Bit 4: 0— reserved for future use
- Bit 5: 0— reserved for future use

Note 4: Encrypted/Hash data sent status

- Field 9: Encrypted data sent status
- Bit 0: 1— track 1 encrypted data present
 - Bit 1: 1— track 2 encrypted data present
 - Bit 2: 1— track 3 encrypted data present
 - Bit 3: 1— track 1 hash data present
 - Bit 4: 1— track 2 hash data present
 - Bit 5: 1— track 3 hash data present
 - Bit 6: 1—session ID present
 - Bit 7: 1—KSN present

10.4 DUKPT Level 3 Data Output Original Format

For ISO cards, both masked clear and encrypted data are sent, no clear data will be sent.

For other cards, only clear data is sent.

A card swipe returns the following data:

Card data is sent out in format of

<STX><LenL><LenH><Card Data><CheckLRC><Checksum><ETX>

<STX> = 02h, <ETX> = 03h

<LenL><LenH> is a two byte length of <Card Data>.

<CheckLRC> is a one byte Exclusive-OR sum calculated for all <Card Data>.

<Checksum> is a one byte Sum value calculated for all <Card data>.

<Card Data> card data format is shown below.

ISO/ABA Data Output Format:

- card encoding type (0: ISO/ABA, 4: for Raw Mode)
- track status (bit 0,1,2:T1,2,3 decode, bit 3,4,5:T1,2,3 sampling)
- track 1 unencrypted length (1 byte, 0 for no track1 data)
- track 2 unencrypted length (1 byte, 0 for no track2 data)
- track 3 unencrypted length (1 byte, 0 for no track3 data)
- track 1 masked (Omitted if in Raw mode)

- track 2 masked (Omitted if in Raw mode)
- track 3 data (Omitted if in Raw mode)
- track 1 encrypted (AES/TDES encrypted data)
- track 2 encrypted (AES/TDES encrypted data)
- track 3 encrypted (Only used in Raw mode)
- track 1 hashed (20 bytes SHA1-Xor)
- track 2 hashed (20 bytes SHA1-Xor)
- DUKPT serial number (10 bytes)

Non ISO/ABA Data Output Format

- card encoding type (1: AAMVA, 3: Others)
- track status (bit 0,1,2:T1,2,3 decode, bit 3,4,5:T1,2,3 sampling)
- track 1 length (1 byte, 0 for no track1 data)
- track 2 length (1 byte, 0 for no track2 data)
- track 3 length (1 byte, 0 for no track3 data)
- track 1 data
- track 2 data
- track 3 data

10.5 DUKPT Level 4 Data Output Original Format

For ISO card, both clear and encrypted data are sent. For other card, only clear data are sent.

A card swipe returns the following data:

Card data is sent out in format of

<STX><LenL><LenH><Card Data><CheckLRC><Checksum><ETX>

<STX> = 02h, <ETX> = 03h

<LenL><LenH> is a two byte length of <Card Data>.

<CheckLRC> is a one byte Exclusive-OR sum calculated for all <Card Data>.

<Checksum> is a one byte Sum value calculated for all <Card data>.

<Card Data> format is

ISO/ABA Data Output Format:

- card encoding type (0: ISO/ABA, 4: for Raw Mode)
- track status (bit 0,1,2:T1,2,3 decode, bit 3,4,5:T1,2,3 sampling)
- track 1 unencrypted length (1 byte, 0 for no track1 data)
- track 2 unencrypted length (1 byte, 0 for no track2 data)
- track 3 unencrypted length (1 byte, 0 for no track3 data)
- if card encoding type high bit set
 - mask and clear sent track status

SecureMag User Manual

■ encrypt and hash sent track status

In this mode tracks are encrypted separately rather than as a group

- track 1 masked (Omitted if in Raw mode)
- track 2 masked (Omitted if in Raw mode)
- track 3 data (Omitted if in Raw mode)
- track 1 encrypted (AES/TDES encrypted data)
- track 2 encrypted (AES/TDES encrypted data)
- sessionID encrypted (AES/TDES encrypted data)
- track 1 hashed (20 bytes SHA1-Xor)
- track 2 hashed (20 bytes SHA1-Xor)
- track 3 hashed (optional) (20 bytes SHA1-Xor)
- DUKPT serial number (10 bytes)

Non ISO/ABA Data Output Format:

- card encoding type (1: AAMVA, 3: Others)
- track status (bit 0,1,2:T1,2,3 decode, bit 3,4,5:T1,2,3 sampling)
- track 1 length (1 byte, 0 for no track1 data)
- track 2 length (1 byte, 0 for no track2 data)
- track 3 length (1 byte, 0 for no track3 data)
- track 1 data
- track 2 data
- track 3 data

Note track formatting (preamble, prefix, separator, etc.) is not supported in a reader set to send encrypted track data. The track data is always sent in the same format that is with no special formatting so that the program doing the decoding can know where is data field is located.

Notes:

Offset to the fields can be determined by adding the field lengths using the track data for the track field lengths. Fields are packed in the next available location.

T1, T2 or T3 Data Length: Each byte value indicates how many bytes of decoded card data are in the track data field. This value will be zero if there was no data on the track or if there was an error decoding the track.

The encrypted section is padded with zeros to the block size of the encryption type, 8 bytes for TDES and 16 bytes for AES.

The hashed data may optionally be omitted, and also track 3 may be hashed and included.

Description:

Track 1 and Track 2 unencrypted Length

This one-byte value is the length of the original Track data. It indicates the number of bytes in the Track masked data field. It should be used to separate Track 1 and Track 2 data after decrypting Track encrypted data field.

Track 3 unencrypted Length

This one-byte value indicates the number of bytes in Track 3 masked data field.

Track 1 and Track 2 masked

Track data masked with the MaskCharID (default is '*'). The first PrePANID (up to 6 for BIN, default is 4) and last PostPANID (up to 4, default is 4) characters can be in the clear (unencrypted). The expiration date is masked by default but can be optionally displayed.

Track 1 and Track 2 encrypted

This field is the encrypted Track data, using either TDES-CBC or AES-CBC with initial vector of 0. If the original data is not a multiple of 8 bytes for TDES or a multiple of 16 bytes for AES, the reader right pads the data with 0.

The key management scheme is DUKPT and the key used for encrypting data is called the Data Key. Data Key is generated by first taking the DUKPT Derived Key exclusive or'ed with 0000000000FF0000 0000000000FF0000 to get the resulting intermediate variant key. The left side of the intermediate variant key is then TDES encrypted with the entire 16-byte variant as the key. After the same steps are performed for the right side of the key, combine the two key parts to create the Data Key.

How to get Encrypted Data Length

Track 1 and Track 2 data are encrypted as a single block. In order to get the number of bytes for encrypted data field, we need to get Track 1 and Track 2 unencrypted length first. The field length is always a multiple of 8 bytes for TDES or multiple of 16 bytes for AES. This value will be zero if there was no data on both tracks or if there was an error decoding both tracks. Once the encrypted data is decrypted, all padding 0 need to be removed. The number of bytes of decoded track 1 data is indicated by track 1 unencrypted length field. The remaining bytes are track 2 data, the length of which is indicated by track 2 unencrypted length filed.

Track 1, 2 and 3 hashed

SecureMag reader uses SHA-1 to generate hashed data for both track 1, track 2 and track 3 unencrypted data. It is 20 bytes long for each track. This is provided with two purposes in mind: One is for the host to ensure data integrity by

comparing this field with a SHA-1 hash of the decrypted Track data, prevent unexpected noise in data transmission. The other purpose is to enable the host to store a token of card data for future use without keeping the sensitive card holder data. This token may be used for comparison with the stored hash data to determine if they are from the same card.

Some Additional notes: (4/28/2011)

1. "Decode status" bits in "track status" byte is set as: 0 for no error (either decode success or no sampling data), or to 1 for error (has sampling data but fail to decode).
2. Please be aware that track status byte in secured output is different from track status bytes in OPOS head (called read error1 and read error2). OPOS header will only be used in OPOS mode security level 1 and level 2 and secure output only used in level 3 or level 4.
3. For USB HID Secure Output, the output format is same as Secure Output structure. No HID header is added. But the total length is the HID standard (537 bytes). Unused bytes will be filled with 0x00. This applied to secure Level 3 and Level 4 output, whether or not the data is encrypted.
4. Examples for field 8 (Clear/mask data sent status) and field 9 (Encrypted/Hash data sent status)

These two bytes are omitted in original structure. In the enhanced encrypt structure, these two byte are used to indicate the presence of each track's Clear or Masked data, Encrypted data and hash data.

Example :

field 8 = 0x03 (00000011)

field 9 = 0xBF (10111111)

T1: Mask data present; Encrypted data present; Hash present

T2: Mask data present; Encrypted data present; Hash present

T3: No Mask data; Encrypted data present; Hash present

KSN: present

Session ID: not present

SecureMag User Manual

<STX><R><80h><02h><Pre-Authentication Time Limit><ETX><LRC>

Device -> Host:

<ACK><STX><Device Response Data><ETX><LRC> (success)

<NAK> (fail)

Pre-Authentication Time Limit: 2 bytes of time in seconds

Device Response Data: 26 bytes data, consists of <Current Key Serial Number>
<Challenge 1> <Challenge 2>

Current Key Serial Number: 10 bytes data with Initial Key Serial Number in the leftmost 59 bits and Encryption Counter in the rightmost 21 bits.

Challenge 1: 8 bytes challenge used to activate authentication. Encrypted using the key derived from the current DUKPT key.

Challenge 2: 8 bytes challenge used to deactivate authentication. Encrypted using the key derived from the current DUKPT key.

Activation Challenge Reply Command

This command serves as the second part of an Activate Authentication sequence. The host sends the first 6 bytes of Challenge 1 from the response of Activate Authenticated Mode command, two bytes of Authenticated mode timeout duration, and eight bytes Session ID encrypted with the result of current DUKPT Key exclusive- or'ed with <3C3C 3C3C 3C3C 3C3C 3C3C 3C3C 3C3C 3C3C>.

The Authenticated mode timeout duration specifies the maximum time in seconds which the reader would remain in Authenticated Mode. A value of zero forces the reader to stay in Authenticated Mode until a card swipe or power down occurs. The minimum timeout duration required is 120 seconds. If the specified time is less than the minimum, 120 seconds would be used for timeout duration. The maximum time allowed is 3600 seconds (one hour).

If Session ID information is included and the command is successful, the Session ID will be changed.

The Activate Authenticated Mode succeeds if the device decrypts Challenge Reply response correctly. If the device cannot decrypt Challenge Reply command, Activate Authenticated Mode fails and DUKPT KSN advances.

Command Structure

Host -> Device:

<STX><S><82h><08h><Activation Data><ETX><LRC>

Device -> Host:

<ACK> (success)

Copyright © 2010, International Technologies & Systems Corp. All rights reserved.

<NAK> (fail)

Activation Data: 8 or 16 bytes, structured as <Challenge 1 Response> <Session ID>

Challenge 1 Response: 6 bytes of Challenge 1 random data with 2 bytes of Authenticated mode timeout duration. It's encrypted using the key derived from the current DUKPT key.

Session ID: Optional 8 bytes Session ID, encrypted using the key derived from the current DUKPT key.

Deactivate Authenticated Mode Command

This command is used to exit Authenticated Mode. Host needs to send the first 7 bytes of Challenge 2 (from the response of Activate Authenticated Mode command) and the Increment Flag (0x00 indicates no increment, 0x01 indicates increment of the KSN) encrypted with current DUKPT Key exclusive- or'ed with <3C3C 3C3C 3C3C 3C3C 3C3C 3C3C 3C3C>.

If device decrypts Challenge 2 successfully, the device will exit Authenticated Mode. The KSN will increase if the Increment flag is set to 0x01. If device cannot decrypt Challenge 2 successfully, it will stay in Authenticated Mode until timeout occurs or when customer swipes a card.

The KSN is incremented every time the authenticated mode is exited by timeout or card swipe action. When the authenticated mode is exited by Deactivate Authenticated Mode command, the KSN will increment when the increment flag is set to 0x01.

Command Structure

Host -> Device:

<STX><S><83h><08h><Deactivation Data><ETX><LRC>

Device -> Host:

<ACK> (success)

<NAK> (fail)

<Deactivation data>: 8-bytes response to Challenge 2. It contains 7 bytes of Challenge 2 with 1 byte of Increment Flag, encrypted by the specified variant of current DUKPT Key

Get Reader Status Command

Command Structure

Host -> Device:

<STX><R><83h><ETX><LRC>

Device -> Host:

<ACK><STX><83h><02h><Current Reader Status><Pre-condition><ETX><LRC>
(success)
<NAK> (fail)

Current Reader Status: 2-bytes data with one byte of <Reader State> and one byte of <Pre-Condition>

Reader State: indicates the current state of the reader

0x00: The reader is waiting for Activate Authentication Mode Command. The command must be sent before the card can be read.

0x01: The authentication request has been sent, the reader is waiting for the Activation Challenge Reply Command.

0x02: The reader is waiting for a card swipe.

Pre-condition: specifies how the reader goes to its current state as follows

0x00: The reader has no card swipes and has not been authenticated since it was powered up.

0x01: Authentication Mode was activated successfully. The reader processed a valid Activation Challenge Reply command.

0x02: The reader receives a good card swipe.

0x03: The reader receives a bad card swipe or the card is invalid.

0x04: Authentication Activation Failed.

0x05: Authentication Deactivation Failed.

0x06: Authentication Activation Timed Out. The Host fails to send an Activation Challenge Reply command within the time specified in the Activate Authentication Mode command.

0x07: Swipe Timed Out. The user fails to swipe a card within the time specified in the Activation Challenge Reply command

Appendix A Setting Parameters and Values

Following is a table of default setting and available settings (value within parentheses) for each function ID.

Function ID	Hex	Description	Default Setting	Description	
HTypeID*	10	Terminal Type	'0' ('0'~'2', '4'~'6')	PC/AT, Scan Code Set 2, 1, 3, PC/AT with external Keyboard and PC/AT without External Keyboard	u
BeepID	11	Beep Setting	'2' ('0'~'4')	Beep volume high and frequency high	
ChaDelayID*	12	Character Delay	'0' ('0'~'5')	2 ms inter-character delay	k

*Unused entries in this table were left for completeness even though unused in the SecureMag reader to avoid conflicting definitions between products.

Note not all function ID are present in different hardware version of the SecureMag the last column above has some codes:

- '-' feature not currently supported; exists for compatibility
- 's' feature available on in the RS232 serial version of the reader
- 'u' feature available only in the USB version;
- 'k' feature available on in the keyboard version
- 'r' reset all does not affect this value
- 'n' not directly settable

Most function ID settings that relate to the content of formatting of the track output do not work in secure mode. Exceptions to this are Preamble and Postamble in keyboard mode only.

It is currently not possible to mix security with OPOS and JPOS support.

Appendix B Key Code Table in USB Keyboard Interface

For most characters, "Shift On" and "Without Shift" will be reverse if Caps Lock is on. Firmware needs to check current Caps Lock status before sending out data.

For Function code B1 to BA, if "Num Lock" is not set, then set it and clear it after finishing sending out code.

For Function code BB to C2, C9 to CC, if "Num Lock" is set then clear it and set it after finishing sending out code.
