# **UniMag Android SDK User Manual**

Before using the ID TECH UniMag Android SDK, please have the following programs installed:

- 1. Android SDK
- 2. Eclipse
- 3. ADT Plugin for Eclipse

Please see <u>http://developer.android.com/sdk/index.html</u> for download links and instructions.

#### To use the UniMag Android SDK

- First, create an Android project. Please see <u>http://developer.android.com/resources/tutorials/hello-world.html</u> for sample instructions.
- 2. Import the UniMag SDK package into the Android project.
  - 1) On the Package Explorer panel, right-click on the project and select "Properties".

2) From the "Java Build Path" menu, select the "Libraries" tab.

4. Implement the interface uniMagReaderMsg in your Activity extension class.

There are six interface functions to implement, please see the following definition of each interface.

public interface uniMagReaderMsg {

public void onReceiveMsgToConnect(); public void onReceiveMsgConnected(); public void onReceiveMsgDisconnected(); public void onReceiveMsgTimeout(String strTimeoutMsg); public void onReceiveMsgToSwipeCard(); public void onReceiveMsgCardData(String strMSRData);

}

Item	Interface	Description
1	onReceiveMsgToConnect	To receive massages when the device is
		powered up
2	onReceiveMsgConnected	To receive massages when the UniMag device
		is connected to the phone
3	onReceiveMsgDisconnected	To receive massages when the UniMag device
		is disconnected to the phone
4	onReceiveMsgTimeout	To receive massages when power up or card
		swipe mode is timed out
5	onReceiveMsgToSwipeCard	To receive massages when you swipe the card
6	onReceiveMsgCardData	To receive the card data

The following is the description for each interface

5. Manage the class uniMagReader to operate the UniMag Reader.

You can manage the class uniMagReader to start or stop swiping a card. First create an instance of uniMagReader and then invoke the function of the class. The class functions are listed below:

public class uniMagReader {

public String getInfoManufacture(); public String getInfoModule(); public void setSaveLogEnable(boolean bSaveLog );

public void startSwipeCard(); public void registerListen(); public void stopSwipeCard(); public void unRegisterListen();

public boolean isSwipeCardRunning();

}

Item	Function	Description
1	String getInfoManufacture()	To get the phone manufacturer
		information.
2	String getInfoModule();	To get the module information.
3	void setSaveLogEnable(boolean	To enable an event log saved in the SD
	bSaveLog );	card root directory
4	<pre>void startSwipeCard();</pre>	To start a card swipe
5	<pre>void registerListen();</pre>	To register to listen to the headset events.
		This function should be invoked when the
		application is launched.
6	<pre>void stopSwipeCard();</pre>	To stop a card swipe event. This function
		should be invoked when the application is
		exited.
7	<pre>void unRegisterListen();</pre>	To unregister to listen the headset events.
		This function should be invoked when the
		application is exited.
8	<pre>boolean isSwipeCardRunning();</pre>	To check to see if a card is being swiped.
		If true, to set log enable is forbidden. If
		false, the event logs can be enabled.

The following is the description for each interface

For more information on how to use the above functions, please refer to the UniMag Android SDK demo source code.

Note:

1. Please do not connect the mobile phone to PC as the USB Mass Storage device when you swipe a card.

2. When the "to power up" dialog shows up on the screen for more than 30 seconds with no timeout error, please verify that the headphone Media Volume is set to maximum and re-plug the UniMag device.
